Motivation

Qualification Exam

Our problem of interest is the time-independent transport equation for a critical system on a domain of interest $\mathbf{r} \in V$ [2],

$$\begin{split} \left[\hat{\Omega} \cdot \nabla + \Sigma_t(\mathbf{r}, E) \right] \psi(\mathbf{r}, E, \hat{\Omega}) \\ &= \int_0^\infty dE' \int_{4\pi} d\hat{\Omega}' \Sigma_s(\mathbf{r}, E' \to E, \hat{\Omega}' \to \hat{\Omega}) \psi(\mathbf{r}, E', \hat{\Omega}') \\ &+ Q(\mathbf{r}, E, \hat{\Omega}) \;, \end{split}$$

with a given boundary condition,

$$\psi(\mathbf{r}, E, \hat{\Omega}) = \Gamma(\mathbf{r}, E, \hat{\Omega}), \quad \mathbf{r} \in \partial V, \quad \hat{\Omega} \cdot \hat{n} < 0$$

Qualification Exam Background

-Steady-state Boltzman Transport Equation

Steady-state Boltzman Transport Equation

 $\left[\hat{\Omega} \cdot \nabla + \Sigma_{t}(\mathbf{r}, E)\right] \psi(\mathbf{r}, E, \hat{\Omega})$ $=\int_{-\infty}^{\infty} dE' \int_{-\infty}^{\infty} d\hat{\Omega}' \Sigma_a(\mathbf{r}, E' \rightarrow E, \hat{\Omega}' \rightarrow \hat{\Omega}) \psi(\mathbf{r}, E', \hat{\Omega}')$

with a given boundary condition

 $\psi(\mathbf{r}, E, \hat{\Omega}) = \Gamma(\mathbf{r}, E, \hat{\Omega}), \quad \mathbf{r} \in \partial V, \quad \hat{\Omega} \cdot \hat{n} < 0$

Acceleration Methods

BART

The multigroup S_N equations

Apply the following discretizations:

- Apply a Petrov-Galerkin scheme in energy (multigroup method), splitting into G coupled equations.
- Apply a collocation scheme in angle, solving at angles $\hat{\Omega}_a$.
- Expanding scattering cross-section in Legendre Polynomials with a maximum degree N (the P_N method).

$$\Sigma_{s,g'g,\ell} = \int_{-1}^{1} \Sigma_{s,g'g}(\mathbf{r},\mu) P_{\ell}(\mu) d\mu, \quad \mu = \hat{\Omega}' \cdot \hat{\Omega}$$
$$\phi_{g,\ell,m} = \int_{A\pi} \phi_{g}(\mathbf{r},\hat{\Omega}') Y_{\ell,m}(\hat{\Omega}') d\hat{\Omega}'$$

Qualification Exam

Multigroup S_N equations

J.S. Rehak

$$\left[\hat{\Omega}_a \cdot \nabla + \Sigma_{t,g}(\mathbf{r})\right] \psi_g(\mathbf{r}, \hat{\Omega}_a)$$

September 4th, 2019

Qualification Exam Background

 \sqsubseteq The multigroup S_N equations

- ullet Multigroup method splits the equations into G coupled equations
- Collocation scheme in angle uses points for a quadrature rule for integrating angular flux to get flux moments
- Expand in Legendre polynomials, use polynomial addition theorem,

Expressed in operator form, this is

$$\mathbf{L}_g \mathbf{\Psi}_g = \mathbf{M} \sum_{g'=0}^G \mathbf{S}_{g'g} \mathbf{\Phi}_{g'} + \mathbf{Q}_g, \quad \mathbf{\Phi}_g = \mathbf{D} \mathbf{\Psi}_g \; .$$

Splitting the scattering source into down-scattering and up-scattering terms,

$$\mathbf{L}_g \mathbf{\Psi}_g = \mathbf{M} \sum_{g'=0}^g \mathbf{S}_{g'g} \mathbf{\Phi}_{g'} + \mathbf{M} \sum_{g'=g+1}^G \mathbf{S}_{g'g} \mathbf{\Phi}_{g'} + \mathbf{Q}_g \; ,$$

And holding the source Q fixed leads to a Gauss-Seidel (scattering) source iteration.

$$\mathbf{L}_g \mathbf{\Psi}_g^{k+1} = \mathbf{M} \sum_{g'=0}^g \mathbf{S}_{g'g} \mathbf{\Phi}_{g'}^{k+1} + \mathbf{M} \sum_{g'=g+1}^G \mathbf{S}_{g'g} \mathbf{\Phi}_{g'}^k + \mathbf{Q}_g \; .$$

Literative Solving Methods

 $\mathbf{L}_{\alpha}\mathbf{\Psi}_{\alpha} = \mathbf{M} \stackrel{G}{\sum} \mathbf{S}_{\alpha'\alpha}\mathbf{\Phi}_{\alpha'} + \mathbf{O}_{\alpha}, \quad \mathbf{\Phi}_{\alpha} = \mathbf{D}\mathbf{\Psi}_{\alpha}$ $\mathbf{L}_{\sigma} \mathbf{\Phi}_{\sigma} = \mathbf{M} \stackrel{g}{\nabla} \mathbf{S}_{\sigma' \sigma} \mathbf{\Phi}_{\sigma'} + \mathbf{M} \stackrel{G}{\nabla} \mathbf{S}_{\sigma' \sigma} \mathbf{\Phi}_{\sigma'} + \mathbf{Q}_{\sigma}$

 $\mathbf{L}_{g}\mathbf{\Phi}_{g}^{k+1} = \mathbf{M} \, \sum^{g} \, \mathbf{S}_{g'g}\mathbf{\Phi}_{g'}^{k+1} + \mathbf{M} \, \sum^{G} \, \, \mathbf{S}_{g'g}\mathbf{\Phi}_{g'}^{k} + \mathbf{Q}_{g}$

- M is the moment-to-discrete. D is the reverse
- Important to note that the G-th energy group is the lowest.

For a multiplying-medium problem, the fixed source \mathbf{Q} is replaced with the fission source,

$$\mathbf{L}_g \mathbf{\Psi}_g = \mathbf{M} \sum_{g'=0}^G \left[\mathbf{S}_{g'g} \mathbf{\Phi}_{g'} + rac{1}{k} \mathbf{F}_{g'} \mathbf{\Phi}_{g'}
ight] \ .$$

Holding the scattering source fixed leads to power iteration (fission source iteration),

$$\mathbf{L}_g \mathbf{\Psi}_g^{k+1} = \mathbf{M} \sum_{g'=0}^G \left[\mathbf{S}_{g'g} \mathbf{\Phi}_{g'}^0 + \frac{1}{k} \mathbf{F}_{g'} \mathbf{\Phi}_{g'}^k \right] \ .$$

Qualification Exam
__BACKGROUND

Laterative Solving Methods

tive Solving Methods

For a multiplying-medium problem, the fixed source C

$$\mathbf{L}_{g}\mathbf{\Phi}_{g} = \mathbf{M}\sum_{g'=0}^{G} \left[\mathbf{S}_{g'g}\mathbf{\Phi}_{g'} + \frac{1}{k}\mathbf{F}_{g'}\mathbf{\Phi}_{g'}\right]$$

Holding the scattering source fixed leads to power iteration (fissic iteration),

$$\mathbf{L}_{g}\mathbf{\boldsymbol{\Phi}}_{g}^{k+1} = \mathbf{M}\sum_{g'=0}^{G}\left[\mathbf{S}_{g'g}\mathbf{\boldsymbol{\Phi}}_{g'}^{0} + \frac{1}{k}\mathbf{F}_{g'}\mathbf{\boldsymbol{\Phi}}_{g'}^{k}\right]$$

 $\mu \frac{\partial}{\partial u} \psi^{k+1}(x, \mu) + \Sigma_t \psi^{k+1}(x, \mu) = \frac{\Sigma_t}{2} \int_{-1}^{1} \psi^k(x, \mu') d\mu' + \frac{Q}{2}$

and subtract the two to set an equation for the error in iteration k, givi

 $\mu \frac{\partial}{\partial x} e^{k+1}(x, \mu) + \Sigma_2 e^{k+1}(x, \mu) = \frac{\Sigma_s}{2} \int_1^1 e^k(x, \mu') d\mu'$

To see how the error in our iterative schemes evolves, we can use Fourier analysis [1]. To do so, we use a one-group, one dimension, infinite homogeneous medium with isotropic scattering.

$$\mu \frac{\partial}{\partial x} \psi(x,\mu) + \Sigma_t \psi(x,\mu) = \frac{\Sigma_s}{2} \int_{-1}^1 \psi(x,\mu') d\mu' + \frac{Q}{2} .$$

We define the source iteration scheme as discussed above.

$$\mu \frac{\partial}{\partial x} \psi^{k+1}(x,\mu) + \Sigma_t \psi^{k+1}(x,\mu) = \frac{\Sigma_s}{2} \int_{-1}^1 \psi^k(x,\mu') d\mu' + \frac{Q}{2}.$$

and subtract the two to get an equation for the error in iteration k, giving us a similar equation for the error in iteration k+1 as it relates to the error in iteration k.

$$\mu \frac{\partial}{\partial x} e^{k+1}(x,\mu) + \Sigma_t e^{k+1}(x,\mu) = \frac{\Sigma_s}{2} \int_{-1}^{1} e^k(x,\mu') d\mu'.$$

Fourier analysis

- How can we be sure that source iteration will converge? What controls the convergence rate? To determine this we can use a Fourier analysis.
- We need to start with a lot of assumptions to get a very simplified version of our transport equation.
- We define what we mean by error, and get an equation that relates the error in each step to the previous step. Unsurprisingly it looks like our original equation, because the evolution of the solution and the evolution of the error are related.

Fourier Analysis

Fourier Analysis

To perform an inverse Fourier transform, we need to choose a measure of spatial variation, an error "wavelength."

$$\lambda = \frac{\ell}{n}, \quad \forall n \in \mathbb{R} \implies \tilde{\nu} = \frac{1}{\lambda} = \frac{n}{\ell} = n \cdot \Sigma_t$$

Perform an inverse Fourier transform.

$$e^k(x,\mu) = \int_{-\infty}^{\infty} \hat{e}^k(n,\mu) e^{i\Sigma_t nx} dn$$
.

After plugging into our equation for error and some rearranging,

$$\int_{-1}^{1} \hat{e}^{k+1}(n,\mu) d\mu = \Lambda(n) \int_{-1}^{1} \hat{e}^{k}(n,\mu') d\mu' ,$$

Where

$$\Lambda(n) = \frac{\Sigma_s}{\Sigma_t} \cdot \frac{\tan^{-1}(n)}{n} .$$

- ullet We can examine the modes of the spatial error by using an inverse fourier transform. This will give us an idea of how the spatial frequencies of the error. We need to decide on an error wavelength, which gives us a linear error frequency. Higher n means higher error frequency, with n=0 being infinite wavelength, completely non-coupled error.
- If we plug this back into our previous equation and do a large amount of manipulation, we get a fairly simple relationship between the integrated error in one step to the integrated error in the previous step.
- ullet This lambda function is maximized when n=0. The lowest frequency error converges the slowest, and at a rate proportional to Σ_s/Σ_t .

Acceleration Methods

Nonlinear Diffusion Acceleration (NDA)

Start, with the single-group first-order transport equation [3], and integrate over angle:

$$\nabla \cdot J_g + (\Sigma_{t,g} - \Sigma_s^{g \to g}) \, \phi_g = \sum_{g' \neq g} \Sigma_s^{g' \to g} \phi_{g'} + q_g, \quad J_g \equiv \int d\hat{\Omega} \hat{\Omega} \psi_g(\hat{\Omega}) \, .$$

As a closure to this problem, it is common to define current using Fick's law.

$$J_a = -D\nabla\phi_a$$
.

Construct an additive correction to the current using information from an angular solve:

$$\begin{split} J_g &= -D\nabla\phi_g + J_g^{\mathsf{ang}} - J_g^{\mathsf{ang}} \\ &= -D\nabla\phi_g + \int_{4\pi} d\hat{\Omega}\hat{\Omega}\psi_g + D\nabla\phi_g \end{split}$$

Qualification Exam
Acceleration Methods

☐ Nonlinear Diffusion Acceleration (NDA)

Womman Unitiesion Acceleration (UUA) and integration and agreement of the transport of the transport of the fit transport for B_1 and B_2 and B_3 and B_4 and

- Uses a lower order diffusion solve to accelerate a higher order solve.
- Start with the same single-group first-order transport equation, multiply by and integrate over angle, giving the "neutron continuity equation."
- We need closure for this problem, so often we use Fick's law, we will introduce a correction onto Fick's Law based on a higher order solve.
- We will introduce an additive correction based on our two definitions of the current.

Fold the additive correction into a drift-diffusion vector:

$$J_g = -D\nabla\phi_g + \int_{4\pi} d\hat{\Omega}\hat{\Omega}\psi_g + D\nabla\phi_g$$
$$= -D\nabla\phi_g + \left[\frac{\int_{4\pi} d\hat{\Omega}\hat{\Omega}\psi_g + D\nabla\phi_g}{\phi_g}\right]\phi_g$$
$$= -D\nabla\phi_g + \hat{D}_g\phi_g .$$

Plugging this into our integrated transport equation gives the low-order non-linear diffusion acceleration equation (LONDA),

$$\nabla \cdot \left[-D\nabla + \hat{D}_g \right] \phi_g + \left(\Sigma_{t,g} - \Sigma_s^{g \to g} \right) \phi_g = \sum_{g' \neq g} \Sigma_s^{g' \to g} \phi_{g'} + q_g$$

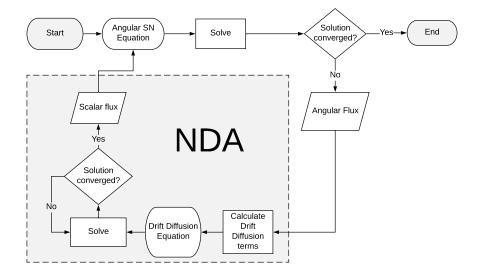

Qualification Exam
Acceleration Methods

Nonlinear Diffusion Acceleration (NDA)

- We combine these corrections into a drift diffusion vector.
- This gives us the LONDA equation, which is just the same integrated transport equation with a corrected current term.
- Presumably, the "higher order" angular solve will have better current information, so we can use it to calculate the drift diffusion vector.

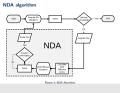

J.S. Rehak

NDA algorithm

Qualification Exam
Acceleration Methods

□NDA algorithm

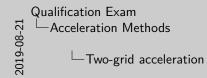

- NDA algorithm showing inner low order loop, and outer high order loop.
- In general, outer loop updates both scattering and fission source, checking for k convergence. Inner loop updates fission source, also checking k convergence.

Transport equation second-order forms

Consider the mono-energetic form of the transport equation, using the scattering operator $S\psi(\mathbf{r},\hat{\Omega}) = \int_{A\pi} d\hat{\Omega}' \Sigma_s(\mathbf{r},\hat{\Omega}' \to \hat{\Omega}) \psi(\mathbf{r},\hat{\Omega}')$:

$$\left[\hat{\Omega} \cdot \nabla + \Sigma_t(\mathbf{r})\right] \psi(\mathbf{r}, \hat{\Omega}) = S\psi(\mathbf{r}, \hat{\Omega}) + Q \tag{1}$$

Substitute $-\hat{\Omega}$ for $\hat{\Omega}$, add to Eq. (1), and divide by two to get a function of even- and odd-parity angular fluxes.

$$\hat{\Omega} \cdot \nabla \psi^- + \Sigma_t \psi^+ = S^+ \psi^+ + Q^+$$

where,

$$\psi^{+} = \frac{1}{2} \left(\psi(\hat{\Omega}) + \psi(-\hat{\Omega}) \right)$$
$$\psi^{-} = \frac{1}{2} \left(\psi(\hat{\Omega}) - \psi(-\hat{\Omega}) \right)$$

Qualification Exam BART

Transport equation second-order forms

scattering operator $S\psi(\mathbf{r}, \Omega) = \int_{\delta \mathbf{r}} d\Omega^r \Sigma_s(\mathbf{r}, \Omega^r \to \Omega) \psi(\mathbf{r}, \Omega^r)$:

of even- and odd-parity angular fluxes.

$$\Omega \cdot \nabla \psi^- + \Sigma_t \psi^+ = S^+ \psi^+ + Q^+$$

$$\omega^{+} = \frac{1}{2} \left(\omega(\hat{\mathbf{0}}) + \omega(-\hat{\mathbf{0}}) \right)$$

$$\psi^{+} = \frac{1}{2} \left(\psi(\hat{\Omega}) + \psi(-\hat{\Omega}) \right)$$

 $\psi^{-} = \frac{1}{2} \left(\psi(\Omega) - \psi(-\Omega) \right)$

 $\psi = f$, $\dot{\Omega} \cdot \dot{n} < 0$ $\hat{\Omega} \cdot \nabla \psi + \Sigma_t \psi = S \psi + q, \quad \hat{\Omega} \cdot \hat{n} > 0$

Self-adjoint angular flux equation (SAAF)

Start with the single-group first-order transport equation [4]:

$$\hat{\Omega} \cdot \nabla \psi + \Sigma_t \psi = S\psi + q . \tag{2}$$

Solve for ψ .

$$\psi = \frac{1}{\sum_{t}} \left[S\psi + q - \hat{\Omega} \cdot \nabla \psi \right] ,$$

and plug back into the gradient term in Eq.2.

$$-\hat{\Omega} \cdot \nabla \frac{1}{\Sigma_t} \hat{\Omega} \cdot \nabla \psi + \Sigma_t \psi = S\psi + q - \hat{\Omega} \cdot \nabla \frac{S\psi + q}{4\pi}$$

With boundary conditions, for all $\mathbf{r} \in \partial D$:

$$\psi = f, \quad \hat{\Omega} \cdot \hat{n} < 0$$

$$\hat{\Omega} \cdot \nabla \psi + \Sigma_t \psi = S\psi + q, \quad \hat{\Omega} \cdot \hat{n} > 0$$

The Self-adjoint angular flux equation (SAAF) is a second-order from of the transport equation introduced by Morel and McGhee in 1999. To derive, consider scattering term part of the source. Properties of SAAF

- +Can solve using standard CFEM methods, which give SPD matrices (can use CG instead of GMRES)
- +Full angular flux is obtained by solve (unlike Even/Odd parity)
- +BCs only coupled in one direction when reflective

Self-adjoint angular flux equation (SAAF)

- General sparse matrix, not block lower-triangular (no sweeping)
- -Pure scattering causes issues like odd-parity

Introduce a discretization of the energy domain \mathbb{E} into G non-overlapping elements, such that

$$E_h = \{E_1, E_2, \dots, E_G\}, \quad \mathbb{E} = \bigcup_{g=1}^G E_g$$

Assume that the energy-dependent angular flux can be separated into a group angular flux and a energy function within each of these groups

$$\psi(\mathbf{r}, E, \hat{\Omega}) \approx \psi_a(\mathbf{r}, \hat{\Omega}) f_a(E), \quad E \in E_a$$

This gives us G coupled equations for each energy group, converting the integral scattering term into a summation,

$$\left[\hat{\Omega} \cdot \nabla + \Sigma_{t,g}(\mathbf{r})\right] \psi_g(\mathbf{r}, \hat{\Omega}) = \sum_{g'=0}^{G} \Sigma_{s,g' \to g}(\mathbf{r}, \hat{\Omega}' \to \hat{\Omega}) \psi_{g'}(\mathbf{r}, \hat{\Omega}') + Q_g(\mathbf{r}, \hat{\Omega}) .$$

Qualification Exam Backup Slides Energy discretization

introduce a discretization of the energy domain E into G non-overlapping

 $E_h = \{E_1, E_2, \dots, E_G\}, \quad \mathbb{E} = \bigcup^G E_g$

Assume that the energy-dependent angular flux can be separated into group angular flux and a energy function within each of these groups $\psi(\mathbf{r}, E, \hat{\Omega}) \approx \psi_*(\mathbf{r}, \hat{\Omega}) f_*(E), E \in E_*$ This gives us G coupled equations for each energy group, converting the integral scattering term into a summation.

 $\left[\hat{\Omega} \cdot \nabla + \Sigma_{\ell,g}(\mathbf{r})\right] \psi_g(\mathbf{r}, \hat{\Omega}) = \sum_{i}^{G} \Sigma_{s,g' \to g}(\mathbf{r}, \hat{\Omega}' \to \hat{\Omega}) \psi_{g'}(\mathbf{r}, \hat{\Omega}') + Q_g(\mathbf{r}, \hat{\Omega})$

• Say that the function f_q is zero inside element, and 0 outside, Petroy-Galerkin scheme.
